

Prove Me Wrong

Every founder in this room has shipped a positioning the web could have refuted for five dollars. I built the thing that asks.

A Bright Data hypothesis-breaker: SERP API · Web Scraper API · Web Unlocker · a coding agent as the analyst

Give it what you believe. It looks for the people who disagree.

```
// engine/hypothesis.json — the worked example
{ "product": "Moment",
  "hypotheses": {
    "H1": "Meditation apps overwhelm people with content and choice.",
    "H2": "The calm stays in the session: people are still reactive in
real life." },
  "community": ["reddit.com/r/Meditation",
"reddit.com/r/selfimprovement"],
  "competitors": ["Calm", "Headspace", "Waking Up"],
  "apps": { "play": ["com.calm.android", "com.getsomeheadspace.android",
...] },
  "queries": { "gap": [5 ...], "refute": [4 ...], "competition": [3 ...] } }
```

What comes back

A verdict page: what held, what was refuted, what nobody is doing — every line a verbatim quote or a computed number, every source credited by the path that served it.

The only moving part is Bright Data. Three APIs, each doing the job it is best at; a coding agent reads the rows and writes the verdict.

node src/provemewrong.js → out/verdict-input.json → research.json → the page

Three calls do the asking. One Bearer token.

```
// 1 · SERP API — Google, parsed for you
POST api.brightdata.com/request
{ zone: SERP_ZONE, format: "raw",
  url: "google.com/search?q=...&brd_json=1" }
→ { organic:[{rank,title,link,description}],
    people_also_ask:[...], related:[...] }

# today: 12 queries · 92 rows · 12/12 answered
# + 30 reddit threads via site:reddit.com/r/...
```

```
// 2 · Web Scraper API — structured, async
POST /datasets/v3/trigger?dataset_id=gd_m6zagkt...
  [{ url: ".../details?id=com.calm.android" }, ×3]
→ { snapshot_id }
GET /datasets/v3/progress/{id} (poll)
GET /datasets/v3/snapshot/{id}?format=json
→ [{ review_rating, review, reviewer_name, ... }]

# served: 300 reviews · 100 per app · 179 s · 0 errors
```

```
// 3 · Web Unlocker — any URL, blocks handled
POST api.brightdata.com/request
{ zone: UNLOCKER_ZONE, url, format: "raw" } → body
# today: 4/5 pages · play.google.com 1.2 MB · headspace
451 KB
# apps.apple.com: HTTP 200, empty body — recorded, not
hidden
```

The rule that makes it a test

Every row records which path served it (`via`). Apple's 450 reviews came from Apple's public feed, not Bright Data — and the page says so. Errors arrive as HTTP 200 with the truth in x-brd-error-code; surface it, never JSON.parse blindly.

Search only for people who agree, and the web will agree.

```
"queries": {
  "gap": [ "meditate every day but still reactive",
          "site:reddit.com/r/Meditation still reactive" ],
  "refute": [ "meditation made me less reactive",           // the
              "does meditation carry over into daily life",
              "site:reddit.com/r/Meditation changed how I react" ],
  "competition": [ "mindfulness bell app random reminders",
                   "one minute meditation reminder app" ] // to hurt
}
for (const q of all) rows.push...(await serp(q)).organic);
```

Two tricks

Bucket the queries: gap / refute / competition. At least a third must be able to refute you, or you are doing marketing, not research.

site: through SERP: reddit.com is KYC-gated on the Unlocker. `site:reddit.com/r/Meditation ...` through the SERP zone gives you titles + snippets of the exact threads — no KYC, no HTML.

12 queries · 4 written to refute · 92 rows · 12/12 answered · ~25 s on a good day, retries on a captcha day

Zones have policies. Design for the “no” before you get it.

HOST	WHAT WE ASKED FOR	WHAT CAME BACK	RECORDED AS
play.google.com	the Play store page	200 OK · 1.2 MB	via: web-unlocker · ok
headspace.com · healthline.com	top gap/competition links	451 KB · 589 KB	title · meta · first 1,500 chars
apps.apple.com	the App Store page	HTTP 200 · empty body	status: failed · error text kept
itunes.apple.com · reddit.com	review feed · thread JSON	destination_ip_prohibited · Residential Failed (bad_endpoint) ... no KYC	fallback: public feed · SERP site:

```
const code = res.headers.get('x-brd-error-code'); // captcha · expect_body
if (code) throw err(code); if (!html.trim()) throw err('empty body');
```

At a data event, the honest “no” is part of the product.

Three Play-store URLs in. Three hundred structured reviews out. Three minutes.

```
GET /datasets/list → 1,743 datasets · "Google Play Store reviews" = gd_m6zagkt024uwvvwuyu
POST /datasets/v3/trigger?dataset_id=gd_m6zagkt024uwvvwuyu&limit_per_input=100
  [{ url: "...?id=com.calm.android" }, { url: "...?id=com.getsomeheadspace.android" }, { url: "...?id=org.wakingup.android" }]
→ { snapshot_id: "sd_mt3vkhhd29jyfi8u7k" }
GET /datasets/v3/progress/sd_mt3vk... → { status: "ready", records: 300, errors: 0 }
GET /datasets/v3/snapshot/sd_mt3vk...?format=json
→ [{ review_rating: 2, review: "While I like it to remind me to relax, it is sloooooooooow...", found_helpful: 347 }]
```

300 REVIEWS · 179 S · 0 ERRORS · 153 NEGATIVE

Same regex classes as the App Store corpus: 54% paywall fatigue · 11% lost simplicity · 14% choice overload. Two stores, two APIs, one shape — a cross-check, not blended into the page numbers.

"Some days I don't want to discover something new, I just want to return to a old favorite. ... I want a calming app to be calming."

H1: people ask for less. H2: the calm really does stay on the cushion.

210 NEGATIVE APP STORE REVIEWS · SRC/CLUSTERS.JS

Computed by a regex file anyone can rerun. ``node src/verify.js`` checks the page matches.

“Now I just feel overwhelmed with the amount of content. A feature that randomly selects a session would reduce decision fatigue.”

HEADSPACE · APP STORE · APPLE PUBLIC FEED

“meditation helps me identify when I am not being present, However, when another same trigger arose, I was still reactive.”

R/MEDITATION · VIA SERP

“In order to change your behavior, you need to begin to bring your meditative mindset into daily life when you are in the act of making decisions...”

R/MEDITATION · VIA SERP

The web refuted my positioning. The interrupt and the minute both already exist.

- **Mindfulness Bell · Chill · Plum Village**
interval or random bells — #1 and #2 for “mindfulness bell app”
- **One-Moment Meditation®**
#1 and #2 for “one minute meditation reminder app” — a registered mark
- **r/Meditation: “LESS reactive”**
H2 is not universal — recorded as counter-evidence, not hidden

UNCLAIMED — FOUND BY A “GAP” QUERY

*“My morning yoga includes setting an intention for the day...
23 minutes later I'm in the thick of...”*

R/SELFIMPROVEMENT · #1 ORGANIC RESULT · VIA SERP

**Remembering your own sentence at the moment it matters.
The bell is taken. The minute is taken. The intention is not.**

This slide is the ROI: a positioning I would have shipped wrong and a trademark collision, both caught before launch for a few dollars of API calls.

Give me your hypothesis. Let's see who disagrees.

```
$ node src/provemewrong.js --quick "Developers want an AI code reviewer that blocks merges" --community
reddit.com/r/ExperiencedDevs

► Prove Me Wrong · first pass — the full run takes four minutes
  4 × POST api.brightdata.com/request { zone: SERP, url: google.com/search?q=...&brd_json=1 } (in parallel)

verdict (first pass): held — the web talks about this pain in your words · pushback on page one —
"What If Most PR Comments Didn't Need to Block the Merge?" · mechanism exists — sourcegraph.com
4/4 queries answered · 15659 ms · via Bright Data SERP API
```

Take a hypothesis from the room. Run it. Read the pushback out loud. Founders watching their idea get argued with, in public, by the web.

Do this to your own idea tonight.

1 · Two sentences of hypothesis

and the queries that would kill it — a third of them written to refute you.

2 · Three APIs, each for its job

SERP with `brd_json=1` · site: your community · Web Scraper for the rows · Unlocker for the page.

3 · Keep it honest

verbatim quotes, computed numbers, credit the path that served — including the gated ones.
